

EASA Client

EASA Client mode refers to the fashion an EASAP can be chosen to be authored using the EASAP **Builder** tool as opposed to the Web Browser fashion.

The resulting EASAP will run on the User's computer using their **EASA Client** installation instead of their web browser, making the **EASA Client** installation mandatory on every endpoint of EASA.

While EASA supports **EASA Client** mode, new features are not made for it as development is focused on creating and improving **Web Browser Client** functionality. As a result, **EASA Client** documentation is not maintained on these pages and is available in a PDF format on request.

If you would like to know more about authoring in **EASA Client** mode, please let us know at support@easasoftware.com.
